

1 Astronomical Unit = 1.0 AU = 1.49 x 10⁸ kilometers 1 Parsec = 3.26 Light years = 3 x 10¹⁸ centimeters = 206,265 AU 1 Watt = 10⁷ ergs/sec 1 Star = 2 x 10³³ grams		
1 Yard = 36 inches	1 meter = 39.37 inches	1 mile = 5,280 feet
1 Liter = 1000 cm ³	1 inch = 2.54 centimeters	1 kilogram = 2.2 pounds
1 Gallon = 3.78 Liters	1 kilometer = 0.62 miles	

Problem 1 – Convert 11.3 square feet into square centimeters.

Problem 2 – Convert 250 cubic inches into cubic meters.

Problem 3 – Convert 1000 watts/meter² into watts/foot²

Problem 4 – Convert 5 miles into kilometers.

Problem 5 – Convert 1 year into seconds.

Problem 6 – Convert 1 km/sec into parsecs per million years.

Problem 7 - A house is being fitted for solar panels. The roof measures 50 feet x 28 feet. The solar panels cost \$1.00/cm² and generate 0.03 watts/cm². A) What is the maximum electricity generation for the roof in kilowatts? B) How much would the solar panels cost to install? C) What would be the owners cost for the electricity in dollars per watt?

Problem 8 – A box of cereal measures 5 cm x 20 cm x 40 cm and contains 10,000 Froot Loops. What is the volume of a single Froot Loop in cubic millimeters?

Problem 9 – In city driving, a British 2002 Jaguar is advertised as having a gas mileage of 13.7 liters per 100 km, and a 2002 American Mustang has a mileage of 17 mpg. Which car gets the best gas mileage?

Problem 10 – The Space Shuttle used 800,000 gallons of rocket fuel to travel 400 km into space. If one gallon of rocket fuel has the same energy as 5 gallons of gasoline, what is the equivalent gas mileage of the Space Shuttle in gallons of gasoline per mile?

Problem 11 – The length of an Earth day increases by 0.0015 seconds every century. How long will a day be in 3 billion years from now?

Problem 12 – The density of matter in the Milky Way galaxy is 7.0 x 10⁻²⁴ grams/cm³. How many stars are in a cube that is 10 light years on a side?

Problem 13 – At a speed of 300,000 km/sec, how far does light travel in miles in 1 year?

Problem 1 – $11.3 \times (12 \text{ inches/foot}) \times (12 \text{ inches/foot}) \times (2.54 \text{ cm/1 inch}) \times (2.54 \text{ cm/1 inch}) = 10,500 \text{ cm}^2$

Problem 2 – $250 \text{ inch}^3 \times (2.54 \text{ cm/inch})^3 \times (1 \text{ meter/100 cm})^3 = 0.0041 \text{ m}^3$

Problem 3 – $1000 \text{ watts/meter}^2 \times (1 \text{ meter/39.37 inches})^2 \times (12 \text{ inches/foot})^2 = 93.0 \text{ watts/ft}^2$

Problem 4 – $5 \text{ miles} \times (5280 \text{ feet/mile}) \times (12 \text{ inches/foot}) \times (2.54 \text{ cm/inch}) \times (1 \text{ meter/100 cm}) \times (1 \text{ km/1000 meters}) = 8.1 \text{ km}$

Problem 5 – $1 \text{ year} \times (365 \text{ days/year}) \times (24 \text{ hours/day}) \times (60 \text{ minutes/hr}) \times (60 \text{ seconds/minute}) = 31,536,000 \text{ seconds.}$

Problem 6 – $1 \text{ km/sec} \times (100000 \text{ cm/km}) \times (3.1 \times 10^7 \text{ seconds/year}) \times (1 \text{ parsec/ } 3.1 \times 10^{18} \text{ cm}) \times (1,000,000 \text{ years/1 million years}) = 1 \text{ parsec/million years}$

Problem 7 - A) Area = $50 \text{ feet} \times 28 \text{ feet} = 1400 \text{ ft}^2$. Convert to cm^2 : $1400 \times (12 \text{ inch/foot})^2 \times (2.54 \text{ cm/1 inch})^2 = 1,300,642 \text{ cm}^2$. Maximum power = $1,300,642 \text{ cm}^2 \times 0.03 \text{ watts/cm}^2 = 39.0 \text{ kilowatts}$. B) $1,300,642 \text{ cm}^2 \times \$1.00 / \text{cm}^2 = \$1.3 \text{ million}$ C) $\$1,300,000 / 39,000 \text{ watts} = \$33.3 / \text{watt}$.

Problem 8 – Volume of box = $5 \times 20 \times 40 = 4000 \text{ cm}^3$. This contains 10,000 Froot Loops, so each one has a volume of $4,000 \text{ cm}^3 / 10,000 \text{ loops} = 0.4 \text{ cm}^3 / \text{Loop}$. Converting this into cubic millimeters: $0.4 \text{ cm}^3 \times (10 \text{ mm/1 cm})^3 = 400 \text{ mm}^3 / \text{Loop}$.

Problem 9 – Convert both to kilometers per liter. Jaguar = $100 \text{ km} / 13.7 \text{ liters} = 7.3 \text{ km/liter}$. Mustang = $17.0 \times (1 \text{ km} / 0.62 \text{ miles}) \times (1 \text{ gallon} / 3.78 \text{ liters}) = 7.25 \text{ km/liter}$. **They both get similar gas mileage under city conditions.**

Problem 10 – $400 \text{ km} \times (0.62 \text{ miles/km}) = 248 \text{ miles}$. Equivalent gallons of gasoline = $800,000 \text{ gallons rocket fuel} \times (5 \text{ gallons gasoline} / 1 \text{ gallon rocket fuel}) = 4,000,000 \text{ gallons gasoline}$, so the 'mpg' is $248 \text{ miles} / 4000000 = 0.000062 \text{ miles/gallon}$ or **16,130 gallons/mile**.

Problem 11 – $0.00015 \text{ sec/century} \times (1 \text{ century} / 100 \text{ years}) \times 3 \text{ billion years} = 4,500 \text{ seconds}$ or 1.25 hours. The new 'day' would be $24\text{h} - 1.25 = 22.75 \text{ hours long}$.

Problem 12 – First convert to grams per cubic parsec: $7.0 \times 10^{-24} \text{ grams/cm}^3 \times (3.1 \times 10^{18} \text{ cm/parsec})^3 = 2.0 \times 10^{32} \text{ grams/pc}^3$. Then convert to Stars/pc³: $2.0 \times 10^{32} \text{ grams/pc}^3 \times (1 \text{ Star} / 2 \times 10^{33} \text{ grams}) = 0.1 \text{ Stars/pc}^3$. Then compute the volume of the cube: $V = 10 \times 10 \times 10 = 1000 \text{ light years}^3 = 1000 \text{ light years}^3 \times (1 \text{ parsec} / 3.26 \text{ light years})^3 = 28.9 \text{ Parsecs}^3$. Then multiply the density by the volume: $0.1 \text{ Stars/pc}^3 \times (28.9 \text{ Parsecs}^3) = 3.0 \text{ Stars in a volume that is 10 light years on a side}$.

Problem 13 – $300,000 \text{ km/sec} \times (3.1 \times 10^7 \text{ sec/year}) = 9.3 \times 10^{12} \text{ km}$. Then $9.3 \times 10^{12} \text{ km} \times (0.62 \text{ miles/km}) = 5.7 \text{ trillion miles}$.
